

150 Watts

- Wide 4:1 input range
- Complies with EN50155 and EN45545-2
- Baseplate cooled
- Industry standard quarter brick
- Regulated single outputs
- Output trim $\pm 10\%$
- 2.2kVDC to 3.0kVDC isolation
- Efficiency to 92%
- Short circuit, overvoltage and overtemperature protection
- Remote on/off
- -40 °C to +105 °C operation
- 3 year warranty

Dimensions:

QSC150:
2.28 x 1.45 x 0.5" (57.9 x 36.8 x 12.7 mm)

The QSC150 series offers a compact 150W DC-DC converter solution in an industry standard quarter brick package. This series of modules enables effective construction of distributed power architectures. Utilizing the integral baseplate for conduction cooling gives the designer flexibility in system design. The QSC150 series features an industrial operating temperature range and includes protection for over current, over temperature and over voltage. Complies with railway standards EN50155 and EN45545-2.

Application Notes

Input Fusing and Safety Considerations

The QSC150 series converters have no internal fuse. In order to achieve maximum safety and system protection, always use an input line fuse. We recommended a 30 A time delay fuse for nominal 24 V and 15 A time delay fuse for nominal 48 V. It is recommended that the circuit has a transient voltage suppressor diode (TVS) across the input terminals to protect the unit against surge or spike voltages and input reverse voltage (as shown). A suitable part would be SMCJ78A.

Output Voltage Adjustment

The Trim input permits the user to adjust the output voltage up or down 10%. This is accomplished by connecting an external resistor between the Trim pin and either the +Sense pin or the -Sense pin.

To Trim Down

Connecting an external resistor (R_D) between the Trim pin and the Vout (+) (or +Sense) pin decreases the output voltage. The following table can be used to determine the required external resistor (R_D) value to obtain a percentage output voltage change of $\Delta\%$.

Trim Down %	RD (k Ω)				
	5 V	12 V	24 V	28 V	48 V
1%	110.400	660.30	1671.00	1984.00	3106.00

10%	5.980	11.94	59.17	42.14	32.25

Remote Sense

The module will automatically trim the output voltage via the sense pins to the default values either locally or at the load. If not required, the sense pins should be connected locally.

To Trim Up

Connecting an external resistor (R_U) between the Trim pin and the Vout (-) (or -Sense) pin increases the output voltage. The following table can be used to determine the required external resistor (R_U) value to obtain a percentage output voltage change of $\Delta\%$.

Trim Up %	RU (k Ω)				
	5 V	12 V	24 V	28 V	48 V

Thermal Resistance Information

Airflow Derating Graph - Without Heatsink

Air Flow Rate	Typical Rca
Natural Convection 20 ft/min (0.1 m/s)	10.1 °C/W
100 ft/min (0.5 m/s)	8.0 °C/W
200 ft/min (1.0 m/s)	5.4 °C/W
300 ft/min (1.5 m/s)	4.4 °C/W
400 ft/min (2.0 m/s)	3.4 °C/W

Example (Without Heatsink)

To determine the minimum airflow necessary for a QS15048S12 operating at an input voltage of 48 V, an output current of 12.5 A, and a maximum ambient temperature of 40°C:

Determine Power dissipation (Pd): $P_d = P_i - P_o = P_o(1-\eta)/\eta$,

$P_d = 12\text{ V} \times 12.5\text{ A} \times (1-0.9)/0.9 = 16.67\text{ Watts}$

Where P_i = Input power, P_o = Output Power and η = Efficiency

Determine airflow from airflow derating graph using data points for $P_d=16.67\text{ W}$ and $T_a = 40\text{ }^\circ\text{C}$

Minimum airflow= 400 ft./min.

To check that the maximum case temp of 105°C is not exceeded:

Maximum temperature rise is

$\Delta T = P_d \times R_{ca} = 16.67 \times 3.4 = 56.65^\circ\text{C}$.

Maximum case temperature is

$T_c = T_a + \Delta T = 96.68^\circ\text{C} < 105^\circ\text{C}$.

Where: R_{ca} is the thermal resistance from case to ambient environment. T_a is ambient temperature and T_c is case temperature.
